

ABSTRACT OF THE DISCLOSURE

An electrographic printing machine comprising: a first photoconductive member; an imaging device for recording a first latent image on the first photoconductive member to form a second developed image; a first developer unit for developing the first latent image; a second photoconductive member, closely adjacent to the first photoconductive member in a transfer region; a second imaging device for recording a second latent image on the second photoconductive member; a second developer unit for developing the second latent image to form a second developed image; a first transfer station for transferring the second developed image on the second photoconductive member to the first photoconductive member; and a second transfer station for transferring developed images on the first photoconductive member to a recording substrate.
